XX
CC A DNA sequence (AAT27110) codes for 62K antigen (AAR96092) comprising the
CC C-terminal 549 amino acids of hepatitis E virus (HEV) Mexico strain
CC capsid protein (AAR96090). It is obtd. by PCR amplification of HEV Mexico
CC ORF-2 (AAT27108). The amplified fragment is inserted into vector pGEX for
CC prodn. 62K in E. coli cells. Expression of full-length ORF-2 in Sf9
CC insect cells using a baculovirus system also results in prodn. of 62K
CC antigen (see also AAR96101 and AAR96103). 62K represents an improved
CC antigen, in comparison to bacterial expressed proteins, for use in HEV
CC diagnostic assays, and also has excellent immunogenic properties.

XX
PS Disclosure; Page 71-72; 125pp; English.
XX
CC The hepatitis E virus (HEV) Mexico strain ORF-2 (AAT27108) codes for the
CC putative capsid protein (AAR96090). PCR amplification of ORF-2 allows
CC prodn. of capsid protein or of C-terminal regions of the capsid protein
CC (see also AAR96092, AAR96094 and AAR96096) and expression in Spodoptera
CC frugiperda Sf9 insect cells using a baculovirus vector provides
CC recombinant C-terminal regions (see also AAR96102 and AAR96104) useful as
CC diagnostic reagents and in vaccines. The HEV Burma strain ORF-2
CC (AAT27107) may similarly be used. (Updated on 16-OCT-2003 to standardise
CC OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 25-28; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence encodes the protein from the open reading frame,
CC   ORF2, from HEV Mexico strain. The method can be used to diagnose
CC   infection with the enterically transmitted non-A/non-B viral hepatitis
CC   agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-
CC   MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS
CC   field)

PT Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT encoding it - useful for more accurate detection of HEV in samples, using
PT immuno-assays and nucleic acid hybridisation.
XX
PS Claim 1; Page 15-17; 29pp; Japanese.
XX
CC This sequence encodes a Hepatitis E viral hollow particle protein
CC described as ORF2. This polypeptide can be used to raise antibodies to
CC detect HEV infection in samples, e.g. by immuno-assay based techniques,
CC and the nucleic acid can be used for the same in nucleic acid
CC hybridisation assays. The polypeptide and nucleic acid allow more
CC accurate detection of HEV than previously possible

XX
CC   A DNA sequence (AAT27109) codes for 62K antigen (AAR96091) comprising the
CC   C-terminal 549 amino acids of hepatitis E virus (HEV) Burma strain capsid
CC   protein (AAR96089). It is obtd. by PCR amplification of HEV Burma ORF-2
CC   (AAT27107) from pBET1 plasmid. The amplified fragment is inserted into
CC   vector pGEX for prodn. 62K in E. coli cells. Expression of full-length
CC   ORF-2 in Sf9 insect cells using a baculovirus system also results in
CC   prodn. of 62K antigen (see also AAR96101 and AAR96103). 62K represents an
CC   improved antigen, in comparison to bacterial expressed proteins, for use
CC   in HEV diagnostic assays, and also has excellent immunogenic properties.
CC   (Updated on 16-OCT-2003 to standardise OS field)

PT   New immunogenic hepatitis E virus (HEV) peptide(s) - are from the ORF1,
PT   ORF2 and ORF3 regions of HEV, useful as a vaccine against HEV infection.
XX
PS   Disclosure; Fig 7; 48pp; English.
XX
CC   Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1,
CC   ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to
CC   prevent infection by HEV. The antibodies can neutralise and block HEV
CC   infection and can be used to prevent or treat HEV infection. The peptides
CC   and antibodies can also be used as diagnostic reagents. (Updated on 25-
CC   MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS
CC   field)

PT   Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids
PT   encoding it - useful for more accurate detection of HEV in samples, using
PT   immuno-assays and nucleic acid hybridisation.
XX
PS   Claim 13; Page 24-26; 29pp; Japanese.
XX
CC   This sequence encodes a Hepatitis E viral hollow particle protein. This
CC   polypeptide can be used to raise antibodies to detect HEV infection in
CC   samples, e.g. by immuno-assay based techniques, and the nucleic acid can
CC   be used for the same in nucleic acid hybridisation assays. The
CC   polypeptides and nucleic acids allow more accurate detection of HEV than
CC   previously possible

PT Antigens of hepatitis E virus (HEV) - selectively immuno:reactive to
PT convalescent and/or acute phase circulating antibodies to HEV.
XX
PS Disclosure; Page 39-41; 78pp; English.
XX
CC RNA from an HEV strain isolated in the Xinjiang region of China was
CC subjected to RT-PCR to obtain fragments corresp. to ORF2 (given in
CC AAQ86592) and ORF3 (AAQ86593) that encoded antigenic proteins (AAR70323-
CC 24, respectively). DNA fragments were manipulated into pGEX vectors for
CC production of GST fusion proteins in E. coli. Applications include HEV
CC infection diagnosis, therapy and vaccine development. (Updated on 25-MAR-
CC 2003 to correct PN field.)

PT   Polypeptide fragments of hepatitis E virus (HEV) for vaccine compositions
PT   and diagnosis in preventing and treating HEV infection.
XX
PS   Example 1; Page 82-83; 91pp; Chinese.
XX
CC   The sequence encodes hepatitis E virus (HEV) ORF-2 polypeptide. The
CC   invention relates to novel n-mer polypeptides comprising amino acids of
CC   ORF-2 of HEV where n = 2-180. The polypeptides of the invention have
CC   virucide activity. The polypeptide of HEV, its fragments, and chimeric
CC   proteins, are useful for vaccine compositions and diagnosis in preventing
CC   and treating HEV infection by immunisation, which may also be applied in
CC   the diagnosis of HEV infection

PT treating hepatitis E virus infection.
XX
PS Example 1; Page 131-133; 165pp; Chinese.
XX
CC The invention relates to a monoclonal antibody that binds specifically to
CC hepatitis E virus open-reading frame (ORF) 2. Also disclosed are
CC nucleotide sequences encoding the heavy-chain and/or light-chain variable
CC region of their degeneration sequences. The monoclonal antibody is
CC selected from anti-HEV monoclonal antibody 8C11 secreted by hybridoma
CC CCTCC-C200116, anti-HEV monoclonal antibody 13D8 secreted by hybridoma
CC CCTCC-C200114, anti-HEV monoclonal antibody 8H3 secreted by hybridoma
CC CCTCC-C200117, and anti-HEV monoclonal antibody 16D7 secreted by
CC hybridoma CCTCC-C200114. The monoclonal antibodies and their active
CC fragments are useful in diagnosis and developing remedies e.g. vaccines
CC for preventing or treating hepatitis E virus infection. From the whole
CC HEV gene obtained in patients, the HEV ORF fragment was prepared by using
CC the method of Aye et al. The polypeptide NE2 was then expressed and
CC isolated after biotechnological manipulations, which was characterised.
CC Its analogs were also produced for immunising mice and construction of
CC hybridomas. Tests were carried out to confirm usefulness of such
CC polypeptides and monoclonal antibodies. The current sequence represents
CC the HEV ORF2 encoding DNA.

PT Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT immunoassay with hepatitis E virus peptide antigens.
XX
PS Disclosure; Col 23-24; 36pp; English.
XX
CC A method has been developed for detecting hepatitis E virus (HEV)
CC antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC HEV peptide antigen; and (b) examining the peptide for the presence of
CC bound Ab, where the presence of bound Ab indicates the presence of HEV
CC Ab. The present sequence encodes the protein from the open reading frame,
CC ORF2, from HEV Burma strain. The method can be used to diagnose infection
CC with the enterically transmitted non-A/non-B viral hepatitis agent HEV,
CC specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to
CC correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)

PT   New immunoreactive peptide pE2, cloned from the genome of a Chinese
PT   strain of hepatitis E virus (HEV), for detecting and diagnosing HEV
PT   infection and for use as a vaccine for prevention of the viral infection
PT   in humans.
XX
PS   Disclosure; Fig 2A-2D; 101pp; English.
XX
CC   The present sequence for hepatitis E virus (HEV) ORF2 cDNA is used to
CC   clone a cDNA fragment E2 (AAS01434) which encodes for a novel peptide,
CC   pE2. During the cloning of the E2 fragment a single base deletion
CC   (presumed to be a PCR amplification error) at position 1811 of ORF2
CC   resulted in a frame shift causing the premature termination at a new stop
CC   codon at position 1820-1822, and giving rise to a smaller peptide, pE2.
CC   Peptide pE2 is a highly immunoreactive viral peptide which can be used in
CC   the development of diagnostic methods for the detection of HEV. Peptide
CC   pE2 which has antigenic activity is also useful as a vaccine for
CC   immunising an individual against infection from HEV and for determining
CC   the presence of HEV antibodies in a biological test sample such as human
CC   blood serum or plasma for detection and diagnosis of HEV infection. An
CC   antibody against pE2 is useful for detecting an HEV particle, in a
CC   biological test sample. The use of recombinant peptides such as pE2
CC   peptide have advantage over the prior art of using live intact virus
CC   particles by avoiding the potential risk of infectivity. The ORF3
CC   (AAS01449) of HEV Chinese strain D11092 is used to clone a cDNA fragment
CC   E3 (AAS01450) which encodes pE3 peptide. (Updated on 11-SEP-2003 to
CC   standardise OS field)

XX
CC   The hepatitis E virus (HEV) Burma strain ORF-2 (AAT27107) codes for the
CC   putative capsid protein (AAR96089). PCR amplification of ORF-2 allows
CC   prodn. of capsid protein or of C-terminal regions of the capsid protein
CC   (see also AAR96091, AAR96093 and AAR96095) and expression in Spodoptera
CC   frugiperda Sf9 insect cells using a baculovirus vector provides
CC   recombinant C-terminal regions (see also AAR96101 and AAR96103) useful as
CC   diagnostic reagents and in vaccines. The HEV Mexico strain ORF-2
CC   (AAT27108) may similarly be used. (Updated on 16-OCT-2003 to standardise
CC   OS field)

PT New swine hepatitis E virus open-reading frame-2 protein and DNA encoding
PT the protein, useful for immunizing a mammal, producing antibodies and
PT detecting antibodies to hepatitis E virus in a biological sample.
XX
PS Disclosure; Fig 1B; 70pp; English.
XX
CC This DNA encodes a swine hepatitis E virus (HEV) open reading frame (ORF)
CC 2 protein. The protein can be expressed by standard recombinant
CC methodology. The ORF2 protein is useful for detecting antibodies to HEV
CC in a biological sample and for producing antibodies. The antibodies are
CC useful for detecting HEV in a biological sample, which is useful in
CC diagnosis of infection and disease caused by swine HEV, and for
CC monitoring the progression of such disease. The method is also useful for
CC monitoring the efficacy of therapeutic agents during the course of
CC treatment of HEV infection and disease in a mammal. The ORF2 protein can
CC be useful as diagnostic agent and as vaccine. The antibodies are useful
CC as anti-viral agent, and as a means for enhancing the immune response.
CC The ORF2 protein is sufficiently closely related to human HEV, and allows
CC evaluation as a potential source of infection in humans

PT Polypeptide fragments of hepatitis E virus (HEV) for vaccine compositions
PT and diagnosis in preventing and treating HEV infection.
XX
PS Example 1; Page 83-84; 91pp; Chinese.
XX
CC The sequence encodes hepatitis E virus (HEV) ORF-2 polypeptide. The
CC invention relates to novel n-mer polypeptides comprising amino acids of
CC ORF-2 of HEV where n = 2-180. The polypeptides of the invention have
CC virucide activity. The polypeptide of HEV, its fragments, and chimeric
CC proteins, are useful for vaccine compositions and diagnosis in preventing
CC and treating HEV infection by immunisation, which may also be applied in
CC the diagnosis of HEV infection

PT Hepatitis E virus monoclonal antibodies and their active fragments, for
PT use in diagnosis and developing remedies e.g. vaccines for preventing or
PT treating hepatitis E virus infection.
XX
PS Example 1; Page 133-135; 165pp; Chinese.
XX
CC The invention relates to a monoclonal antibody that binds specifically to
CC hepatitis E virus open-reading frame (ORF) 2. Also disclosed are
CC nucleotide sequences encoding the heavy-chain and/or light-chain variable
CC region of their degeneration sequences. The monoclonal antibody is
CC selected from anti-HEV monoclonal antibody 8C11 secreted by hybridoma
CC CCTCC-C200116, anti-HEV monoclonal antibody 13D8 secreted by hybridoma
CC CCTCC-C200114, anti-HEV monoclonal antibody 8H3 secreted by hybridoma
CC CCTCC-C200117, and anti-HEV monoclonal antibody 16D7 secreted by
CC hybridoma CCTCC-C200114. The monoclonal antibodies and their active
CC fragments are useful in diagnosis and developing remedies e.g. vaccines
CC for preventing or treating hepatitis E virus infection. From the whole
CC HEV gene obtained in patients, the HEV ORF fragment was prepared by using
CC the method of Aye et al. The polypeptide NE2 was then expressed and
CC isolated after biotechnological manipulations, which was characterised.
CC Its analogs were also produced for immunising mice and construction of
CC hybridomas. Tests were carried out to confirm usefulness of such
CC polypeptides and monoclonal antibodies. The current sequence represents a
CC HEV related DNA.

PT Epidemic non-A, non-B hepatitis virus antigen peptide (I) - and a nucleic
PT acid (II) fragment coding it.
XX
PS Claim 3; Fig 1; 15pp; Japanese.
XX
CC The sequence is that encoding an epidemic non-A, non-B hepatitis (NANBH)
CC virus antigen peptide. The peptide is useful for the detection of NANBH
CC virus by immunoassay of the antibody relates to epidemic NANBH virus in
CC which the peptide is used as an antigen. (Updated on 27-AUG-2003 to
CC correct OS field.)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 31-32; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence encodes a specifically claimed HEV peptide
CC   antigen. The method can be used to diagnose infection with the
CC   enterically transmitted non-A/non-B viral hepatitis agent HEV,
CC   specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to
CC   correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)

PT   Detection of United States isolates of hepatitis E virus.
XX
PS   Example 5; Page 192; 260pp; English.
XX
CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection. The
CC   present sequence represents a HEV US subtype specific sequence obtained
CC   by PCR amplification

CC   A DNA sequence (AAT27111) codes for SG3 antigen (AAR96093) comprising the
CC   C-terminal 327 amino acids of hepatitis E virus (HEV) Burma strain capsid
CC   protein (AAR96089). It is obtd. by PCR amplification of pBET1 contg. the
CC   HEV ORF-2 (AAT27107) and ORF-3 (AAT27115). The amplified fragment is
CC   inserted into pBluescript and the cloned insert is ligated into vector
CC   pGEX for prodn. of SG3 in E. coli cells SG3 shows low antigenicity
CC   compared with 62K antigen (see also AAR96091-92 and AAR96101-04) from HEV
CC   Burma and Mexico strain capsid proteins, produced using a baculovirus
CC   expression system. (Updated on 16-OCT-2003 to standardise OS field)

PT   Diagnosis of hepatitis E virus Burma and Mexico strain infection - by
PT   immunoassay with hepatitis E virus peptide antigens.
XX
PS   Disclosure; Col 29-32; 36pp; English.
XX
CC   A method has been developed for detecting hepatitis E virus (HEV)
CC   antibodies (Ab). The method comprises: (a) reacting a serum sample with a
CC   HEV peptide antigen; and (b) examining the peptide for the presence of
CC   bound Ab, where the presence of bound Ab indicates the presence of HEV
CC   Ab. The present sequence encodes a specifically claimed HEV peptide
CC   antigen. The method can be used to diagnose infection with the
CC   enterically transmitted non-A/non-B viral hepatitis agent HEV,
CC   specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to
CC   correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)

PS   Example 10; Page 233-234; 260pp; English.
XX
CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection. The
CC   present sequence represents a DNA encoding a HEV US and CKS fusion
CC   protein

XX
CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
```

```
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection. The
CC   present sequence represents a DNA encoding a recombinant HEV protein

XX
CC The invention provides a method for detecting a US (sub)type hepatitis E
CC virus (US-HEV), or its naturally occurring variants in a sample by
CC treatment with a binding partner specific for a marker of the virus, and
CC then detecting any complex formed. The method is used to diagnose
CC infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC are useful in vaccines or for passive immunisation. The polypeptides are
CC also used to raise specific antibodies (useful as immunoassay reagents).
CC Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC usual hybridisation and amplification assays for detecting infection. The
CC present sequence represents a HEV US subtype specific sequence obtained
CC by PCR amplification

PT   New immunoreactive peptide pE2, cloned from the genome of a Chinese
PT   strain of hepatitis E virus (HEV), for detecting and diagnosing HEV
PT   infection and for use as a vaccine for prevention of the viral infection
PT   in humans.
XX
PS   Claim 5; Fig 2B-2D; 101pp; English.
XX
CC   The present sequence for hepatitis E virus (HEV) E2 cDNA fragment encodes
CC   for a novel peptide, pE2 which is cloned from ORF2 (AAS01448) of the HEV
CC   Chinese strain D11092 genome. During the cloning of the E2 fragment a
CC   single base deletion (presumed to be a PCR amplification error) at
CC   position 1811 of ORF2 resulted in a frame shift causing the premature
CC   termination at a new stop codon at position 1820-1822, and giving rise to
CC   a smaller peptide, pE2. Peptide pE2 is a highly immunoreactive viral
CC   peptide which can be used in the development of diagnostic methods for
CC   the detection of HEV. Peptide pE2 which has antigenic activity is also
CC   useful as a vaccine for immunising an individual against infection from
CC   HEV and for determining the presence of HEV antibodies in a biological
CC   test sample such as human blood serum or plasma for detection and
CC   diagnosis of HEV infection. An antibody against pE2 is useful for
CC   detecting an HEV particle, in a biological test sample. The use of
CC   recombinant peptides such as pE2 peptide have advantage over the prior
CC   art of using live intact virus particles by avoiding the potential risk
CC   of infectivity. The ORF3 (AAS01449) of HEV Chinese strain D11092 is used
CC   to clone a cDNA fragment E3 (AAS001450) which encodes pE3 peptide

XX
CC The invention provides a method for detecting a US (sub)type hepatitis E
CC virus (US-HEV), or its naturally occurring variants in a sample by
CC treatment with a binding partner specific for a marker of the virus, and
CC then detecting any complex formed. The method is used to diagnose
CC infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC are useful in vaccines or for passive immunisation. The polypeptides are
CC also used to raise specific antibodies (useful as immunoassay reagents).
CC Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC usual hybridisation and amplification assays for detecting infection. The
CC present sequence represents a HEV US subtype specific sequence obtained
CC by PCR amplification

XX
CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection.
CC   Sequences AAZ00300-312 represent conserved nucleic acid sequences from
CC   various strains of HEV

PT   New proteins derived from an enterically transmitted non-A/non-B (ET-
PT   NANB) viral hepatitis agent, useful for diagnosing ET-NANB infection and
PT   producing vaccines for immunizing an individual against ET-NANB hepatitis
PT   viral agent.
XX
PS   Disclosure; SEQ ID NO 13; 81pp; English.
XX
CC   The invention relates to a protein derived from an enterically
CC   transmitted non-A/non-B viral hepatitis agent. The viral proteins are
CC   useful for detecting infection by the enterically transmitted non-A/non-B
CC   (ET-NANB/HEV) hepatitis viral agent. The proteins are also useful for
CC   producing vaccines for immunising an individual against HEV hepatitis
CC   viral agent. The DNA fragments are useful for identifying and sequencing
CC   the entire viral agent and for assaying the viral agent in an infected
CC   sample. The present sequence is used in the exemplification of the
CC   invention.

PS   Disclosure; Col 79-82; 47pp; English.
XX
CC   The present sequence encodes an epitope of the Mexico strain sequence of
CC   enterically transmitted non A non B hepatitis virus (ET-NANB) (hepatitis
CC   E virus (HEV)). The specification describes an isolated protein which is
CC   specifically immunoreactive with antibodies present in individuals
CC   infected with HEV and encoded by a sequence contained in an open reading
CC   frame (ORF) of an HEV genome. The genome has a sequence that is more than
CC   70% identical to the ORF1 sequence from Burma HEV isolate (AAV66321). The
CC   protein is used as a vaccine and a diagnostic probe for ET-NANB. (Updated
CC   on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct
CC   OS field.)

PT   Identifying recombinant antigen immunoreactive with antibody induced by
PT   hepatitis E virus (HEV), for detecting HEV infection, comprises
PT   immunoreacting a polypeptide from an HEV genome with an HEV-positive
PT   antiserum.
XX
PS   Claim 5; Col 79-80; 46pp; English.
XX
CC   The present invention describes a method for identifying a recombinant
CC   antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody.
CC   The method comprises producing a polypeptide derived from an HEV genome,
CC   immunoreacting the polypeptide with an HEV-positive antiserum and
CC   selecting the polypeptide as a recombinant antigen if the polypeptide
CC   reacts with the HEV-positive antiserum. The method is useful for
CC   identifying recombinant antigen immunoreactive with antibody induced by
CC   HEV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also
CC   known as HEV))-specific fragments are useful for identifying ET-NANB-
CC   derived cDNAs, which contain additional sequence information, as primers
CC   for detecting ET-NANB viral genomic material in a patient sample, for the
CC   synthesis of polypeptides for use in immunoassays, and for identifying
CC   similar antigenic regions encoded by related viral strains, e.g. Burmese
CC   strain. The antigens are especially useful in the preparation of vaccine
CC   against ET-NANB infection. These antigens may further be used to prepare
CC   antibodies to ET-NANB virus particles for use directly as antiviral
CC   agents, and to produce antiserum designed for pre- or post-exposure
CC   prophylaxis. The present sequence represents a specifically claimed HEV
CC   Mexican strain derived epitope encoding cDNA clone for use in the present
CC   invention

PT   New DNA sequences of enterically transmitted non-A/non-B (ET-NANB)
PT   hepatitis viral agent, useful in diagnosing infection by an enterically
PT   transmitted agent (e.g. ET-NANB virus), as well as in vaccine production.
XX
PS   Disclosure; Col 79-80; 45pp; English.
XX
CC   The invention relates to an isolated DNA comprising the genome of an
CC   enterically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (also
CC   referred as HEV). The DNA sequences or their fragments are useful in
CC   preparing ET-NANB viral proteins and as probes for virus detection. These
CC   are particularly useful in diagnosing infection by an enterically
CC   transmitted agent (e.g. ET-NANB virus), as well as in vaccine production.
CC   The present sequence represents a cDNA encoding an epitope of HEV that is
CC   derived from the Mexican strain of ET-NANB (HEV). The epitope is
CC   specifically recognised by sera from patients with HEV infections

PT   Detecting the presence of enterically transmitted nonA/nonB hepatitis
PT   viral (HEV) agents in bile samples from infected humans and monkeys using
PT   polymerase chain reaction.
XX
PS   Disclosure; Col 51-52; 61pp; English.
XX
CC   The invention comprises a method for detecting the presence of
CC   enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a
CC   sample and isolating HEV agents or nucleic acid fragments produced by the
CC   agent. The method utilises PCR - using bile from a human or cynomolgus
CC   monkey actively infected with HEV as a source of the agent. The method of
CC   the invention is used for detecting the presence of a viral agent in a
CC   sample of cultured cells infected with the agent and isolating
CC   enterically transmitted nonA/nonB HEV agents or nucleic acid fragments
CC   produced by the agent. The present DNA sequence was isolated from a
CC   Mexican strain of the Hepatitis E virus and encodes an epitopic peptide

XX
CC   The invention provides a method for detecting a US (sub)type hepatitis E
CC   virus (US-HEV), or its naturally occurring variants in a sample by
CC   treatment with a binding partner specific for a marker of the virus, and
CC   then detecting any complex formed. The method is used to diagnose
CC   infection with US-HEV. Polypeptides from US-HEV, antibodies specific for
CC   open reading frames (ORF) in US-HEV and host cells expressing these ORFs
CC   are useful in vaccines or for passive immunisation. The polypeptides are
CC   also used to raise specific antibodies (useful as immunoassay reagents).
CC   Fragments of nucleic acid from US-HEV are useful as primers and probes in
CC   usual hybridisation and amplification assays for detecting infection.
CC   Sequences AAZ00300-312 represent conserved nucleic acid sequences from
CC   various strains of HEV
